

LESSON 4: DIETARY GUIDELINES

amenorrhea
anorexia nervosa
bulimia
diuretics
electrolyte
episodic
esophageal

INTRODUCTION

Today's hurry-up lifestyles, diverse family structures, fast food restaurants, and personal finances have all impacted on the way we eat. Thus, by our actions, America has become a country that is overweight and suffering greatly from cardiovascular disease, cancer, diabetes, and other ailments that hinder our efforts to live a dynamic lifestyle.

In this lesson, we will explain the National Academy of Sciences' 1989 report on how we should eat, as well as some alternative choices that many nutritionists advocate.

DID YOU KNOW?

The American diet consists of a total fat intake between 35 to 40% of the total calories consumed each day.

The National Academy of Sciences believes there is a close association between total fat intake, saturated fat, high cholesterol, and heart disease. They developed nine guidelines for reducing the risk of chronic diseases and helping to provide protection against the possibility of early disease. As you

read through Guidelines #1, #2, #3, #6, #7, and #8, check them against the results of your journal exercises for the first four lessons to get an idea of how well your diet meets the guidelines.

GUIDELINE #1

Goals. Reduce total fat intake to 30 percent or less of your total calories, the estimated fatty acids (building blocks of fat) intake to less than 10 percent of your total calories, and cholesterol intake to less than 300 milligrams.

Tips to achieving those goals.

1. Limit your egg intake. Use two or three egg whites for every yolk. Cholesterol is in the yolk, and egg white is a great source of protein.
2. Use skim milk or one percent milk. Plus, purchase low-fat cheeses, yogurt, and other dairy products.
3. Use margarine sparingly. The soft tub or liquid margarine is best.
4. When ordering in a restaurant, tell the waiter to ask the chef to use only half the oils or fat products he would normally use.
5. Try to eat more fish. Cold water and deep sea running fish are best because of the high omega three oils (fat that may aid in the maintenance of the heart and blood vessels).
6. Eat lean meat, and then sparingly.
7. Bake and broil meat products, if possible.
8. Use the lowest saturated fat cooking oils.

9. When eating snacks, choose low-fat, low sugar content sweets.
10. Learn how to read a label and calculate the fat content in food products.

The diagram at the right shows a sample food label that might appear on a package.

Notes:

Calories: The Food and Drug Administration bases its labeling on a 2000 calorie diet.

Percent of Daily Value: This term tells the percentage of the person's intake of that nutrient based on a 2000 calorie diet.

Fat: The label gives the percentage of fat in that portion which would add to 100 percent of the fat needed for one day, which is 30 percent of the total calories needed for one day.

The bottom of the label has a guide telling you how much of these nutrients you should limit yourself to or take.

ALTERNATIVE GUIDELINE #1

Goals. Reduce fat intake to 20 percent or less of your total calories, saturated fat to five percent of your total, cholesterol intake to 100 milligrams, and use only four to seven teaspoons of mono- or poly-unsaturated fat a day.

Tips to achieving that goal.

Your eating habits can affect your health. Try to develop an eating plan that will keep you at your healthiest level and avoid eating disorders. Presented below is a discussion of two acceptable eating plans and two common, potentially dangerous eating disorders.

Nutrition Facts

Serving Size: 1/2 cup (114 g)

Servings Per Container: 4

Amount Per Serving

Calories 260	Calories from fat 120
% Daily Value*	
Total Fat 13 g	20%
Saturated Fat 5 g	25%
Cholesterol 30 mg	10%
Sodium 660 mg	28%
Potassium 400 mg	11%
Total Carbohydrate 31 g	11%
Sugars 5 g	
Dietary Fiber 0 g	0%
Protein 5 g	10%

Vitamin A 4% Vitamin C 2%

Iron 4% Calcium 15% Vitamin D 25%

* Percent (%) of a Daily Value is based on a 2000 calorie diet. Your Daily Values may vary higher or lower depending on your calorie needs:

		2000	2500
		Calories	Calories
Total Fat	Less than	65 g	80 g
Sat Fat	Less than	20 g	25 g
Cholesterol	Less than	300 mg	300 mg
Sodium	Less than	2400 mg	2400 mg
Potassium		3500 mg	3500 mg
Total Carbohydrate		300 g	375 g
Dietary Fiber		25 g	30 g
Protein		50 g	65 g

Calories per gram

Fat 9 Carbohydrate 4 Protein 4

The Lifetime Eating Plan

Nutritional needs vary at different ages. There are different needs for children (age two to adolescence), adolescents, adults, and the elderly. There are also special conditions and needs for pregnant women.

For example, the special concerns for teens are that they often have erratic eating habits, their calcium requirements are high, and after the onset of menstruation, females need more iron. General dietary recommendations are to ensure you eat sufficient

calories to support your growth and activity levels with high-carbohydrate foods. Also, consume iron-rich foods and keep healthy snacks available.

Pregnant women need to increase their caloric intake and to eat adequate protein, iron, calcium, folic acid, and vitamin C. Proper nutrition is essential to avoid complications, including nausea, heartburn, constipation, and gestational diabetes. General dietary recommendations are to eat two dairy servings daily and two cups of calcium-rich vegetables; also eat green leafy vegetables, legumes, broccoli, asparagus, and whole grains. Avoid overcooking. An obstetrician may recommend supplements. Drink at least eight glasses of liquid daily. Avoid alcohol and caffeine.

The New American Diet — Step by Step

Another popular eating plan is The New American Diet. This plan yields similar dietary recommendations as those explained elsewhere in these nine guidelines. However, the basis for this plan is the development of a healthier lifestyle by following a three step approach: Phase I stresses the use of substitutions to your present diet, Phase II introduces new recipes, and Phase III prescribes a new way of eating.

Eating Disorders

Eating disorders such as **anorexia nervosa** and **bulimia** are very common in today's society. People with anorexia nervosa experience extreme weight loss, **amenorrhea** (absence of a menstrual period), and a variety of psychological disorders culminating in an obsessive preoccupation with the attainment of thinness. Fortunately, most anorectics recover fully after one experience with the disease. However, for 10 to 15 percent of its victims, the disease becomes **episodic** and

relentless, resulting in death from the consequences of starvation.

A person with anorexia nervosa normally exhibits:

- An unwillingness to maintain minimal normal body weight for the individual's age and height; weight loss that leads to the maintenance of a body weight 15 percent below normal; or a failure to gain the amount of weight expected during a period of growth, resulting in a body weight that is 15 percent below normal.
- An inordinate fear of gaining weight and/or becoming fat despite being significantly underweight.
- An unrealistic perception of body weight, size, or shape. The person "feels fat" or perceives that one specific part of the body is "too fat."
- An absence of at least three, otherwise normal, menstrual cycles.

On the other hand, people with bulimia experience alternate cycles of binge eating and restrictive eating. Purging usually follows binges, primarily by self-induced vomiting supplemented with the use of laxatives and **diuretics**. The physical and psychological results of such a struggle with bulimia include **esophageal** inflammation, erosion of tooth enamel caused by repeated vomiting, the possibility of **electrolyte** imbalances, and altered mood states, particularly anxiety and depression.

A person with bulimia normally exhibits:

- An episodic eating binge, characterized by rapid consumption of large amounts of food in a short time.

The following groups will provide guidance for eating disorders:

American Anorexia/Bulimia Association,
New York, NY
(212) 575-6200
Program for Managing Eating Disorders,
New York, NY
(212) 580-3332

- At least two eating binges per week for at least three months, even possibly experiencing a loss of control over eating behavior while in the process of binges.
- Frequent purges after eating; then, engaging in fasting, strict dieting, or vigorous exercise.
- A constant concern over body shape, size, and weight.
- If you think someone has an eating disorder:
 - Express your concern about the person's health. Although the person may deny there is a problem, show that you care.
 - Try to focus on feelings that the person may be experiencing, such as excessive worrying, anxiety, poor self-esteem, anger, or hurt. Encourage the person to talk about issues not related to food. Be a good listener.
 - Encourage the person to talk to parents, relatives, or a health care or mental health professional.
 - Talk to someone else (possibly a professional) about your concerns for that person.

- Do not label the person. That may make the person feel accused and strengthen feelings of denial.

GUIDELINE #2

Goal. Increase starches and other complex carbohydrates. The typical American diet consists of 22 percent complex carbohydrates and 24 percent sugar.

Tips to achieving that goal.

General dietary recommendations are to receive 60 to 65 percent of your diet from the carbohydrate group, 50 to 55 percent of that from the complex carbohydrates, and 20 percent from sugar, with most of that coming from fruits.

ALTERNATIVE GUIDELINE #2

Most all nutritionists agree with the National Academy's number two guidelines. By choosing those percentages, you will receive more than adequate amounts of fiber.

GUIDELINE #3

Goal. Maintain protein intakes at moderate levels.

Americans receive 68 percent of their protein from animal sources (compared to four to five percent for the Chinese). There is evidence pointing to the rise in some cancers with the increase in animal protein.

Tips to achieving that goal.

The body needs no more than 0.45 of a gram of protein per pound of lean body weight per day. Since the minimum requirement is 0.16 grams per pound, 10 to 15 percent of your food should come from

proteins and the majority of that from plant sources.

ALTERNATIVE GUIDELINE #3

The American Heart Association recommends no more than two protein servings daily. However, the U.S. Department of Agriculture recommends two to three servings of the milk, cheese, and yogurt group daily and two to three servings of the meat, poultry, fish, beans, eggs, and nuts group.

GUIDELINE #4

Goal. Balance food intake and physical activity to maintain appropriate body weight.

Approximately 1/3 of the American population is overweight. Overweight teenage boys are more likely to die at a higher than usual rate by the age 45. Teenage girls who are overweight are eight times more likely to have trouble in later years with daily routines such as climbing stairs, lifting, and walking.

ALTERNATIVE GUIDELINE #4

Body weight is not the best indicator of measuring food intake versus physical activity. Measurement of body fat is a healthier indicator and a much more concise measuring tool in determining the best balance of food intake and physical activity. Also, the more fat that accumulates around the stomach represents more of a danger to the person.

Fewer than 10 percent of Americans over age 18 exercise vigorously and regularly. Exercise can decrease a person's chance of dying of heart disease, cancer, and a host of other illnesses.

GUIDELINE #5

Goal. Avoid alcoholic beverages. Alcohol can produce the following problems with nutritional balance and wellness:

- upsets metabolism
- produces fullness, thus the person does not eat a balanced diet
- increases nutritional needs
- causes inadequate assimilation (digestion and absorption) of the nutrients.

GUIDELINE #6

Goal. Limit the daily intake of salt to no more than six grams.

Salt is 60 percent chloride and 40 percent sodium. Too much sodium can lead to high blood pressure in some people (those who are salt sensitive). Furthermore, salt absorbs water in the body, causing the blood pressure to increase because of the larger volume of water the heart must pass through the system.

ALTERNATIVE GUIDELINE #6

1. The National Academy of Sciences recommends no more than 2400 milligrams (1/2 teaspoon) of salt a day. One teaspoon of salt is equivalent to five grams.
2. Switch to "lite" salt, thus reducing the sodium content by one half. Plus, increase potassium (too little increases blood pressure) by using "lite" salt.
3. Eat less processed or manufactured food.

4. Avoid snack food or use unsalted varieties.
5. Limit smoked foods.
6. Limit brine prepared foods such as pickles, olives, and sauerkraut.

GUIDELINE #7

Goal. Maintain adequate calcium intake.

Most Americans do not receive enough calcium from their normal diets. Ninety-nine percent of our body's calcium is present in the bones and teeth. One percent aids in the functioning of the blood, muscles, and nerves.

To meet its need for calcium, the body will pull calcium from the bones, causing them to lose their density. This condition, known as osteoporosis, can lead to hip, leg, and arm fractures. Diets that are low in calcium may also cause hypertension (high blood pressure) and some forms of cancer.

Tips to achieving that goal.

The referenced daily intake for ages 11 to 24 is 1200 milligrams a day. Adult men and women need 1000 milligrams. Pregnant and nursing women also need 1200 milligrams. To prevent osteoporosis:

1. Participate in lifelong weight-bearing exercises to ensure the density of the bones.
2. Avoid excessive protein.
3. Eat a diet rich in calcium (skim milk, certain fruits, and vegetables).

4. Take calcium supplements, if needed.
5. Avoid starvation diets.
6. Avoid alcohol and smoking.

GUIDELINE #8

Goal. Avoid taking dietary supplements in excess of the referenced daily intake in any one day.

Tips to achieving that goal.

There are two schools of thought on this guideline. One says that we can get all of our vitamins and minerals from our normal diet without supplementation. The other opinion is that by taking supplemental dosages of specific vitamins and minerals, we can protect ourselves from birth defects, cataracts, cardiovascular disease, and cancer, and strengthen the immune system.

ALTERNATIVE GUIDELINE #8

1. Take a general vitamin/mineral supplement daily, not to exceed the RDI.
2. Take a calcium supplement.
3. Take antioxidant vitamins in supplemental form: vitamin C, vitamin E, and beta carotene. See the following nutrition prescription for an additional alternative.

Your Nutrition Prescription

Vitamin and mineral supplements are indispensable anti-aging weapons, but too many people use them shotgun style — a handful of this, a bunch of that — instead of coordinating them for the most life-lengthening strategy. To ensure that you are

PERSONAL SUPPLEMENT BLUEPRINT

<u>Supplement</u>	<u>Longevity Standard</u>	<u>My Dose</u>
Beta-carotene	15,000 IU	_____
Vitamin A	10,000 IU	_____
Vitamin B-1	25 mg	_____
Vitamin B-2	25 mg	_____

Zinc	30 mg	_____

* Double-check with your doctor before adding iron to your regimen. Some people are prone to iron overload.

not over- or under-doing any element, you need a prescription customized for your age, gender, health, and lifestyle — just what the six questions below will give you.

For each “yes” answer, follow the directions for revising the Supplement Blueprint. If you end up with more than one recommendation for a particular nutrient, follow the highest single dosage.

1. **Are you male?** Delete iron.

2. **Do you smoke or live/work with a smoker, or do you live in an air-polluted area?** Increase C to 1000 mg, selenium to 400 mcg, beta-carotene to 25000 IU, E to 400 IU, copper to 3 mg, and zinc to 50 mg.
3. **Do you exercise at least three times a week for 20 or more minutes?** Increase E to 400 IU, magnesium to 400 mg, B-1 to 100 mg, and zinc to 50 mg.
4. **Are you on the Pill?** Increase B-6 to 50 mg.
5. **Are you pregnant or nursing?** Increase folic acid to 800 mcg, iron to 60 mg, calcium to 1300 mg, and magnesium to 400 mg. Delete A.
6. **Do you have high cholesterol levels and/or a family history of heart disease?** Increase E to 400 IU, C to 1000 mg, beta-carotene to 25000 IU, chromium to 200 mcg, and magnesium to 400 mg.

According to Ronald Hoffman, MD, Director of the Center for Holistic Medicine in New York City, supplements are especially important for people who do not eat 1) fresh fruits and vegetables daily; 2) dairy products more than once a week; or 3) at least two full meals a day. Some of the above recommendations are higher than the U.S. RDI's because longevity research has leapfrogged

over the old standards. However, all recommendations are well within safety guidelines. Avoid taking more than the amounts suggested; megadosing can be dangerous. Remember, check with your doctor before starting any supplement regimen.

GUIDELINE #9

Goal. Maintain an optimal intake of fluoride, particularly during tooth formation — which normally continues until the beginning of the teenage years. The

requirement for sufficient intake of fluoride begins during pregnancy to ensure proper tooth and bone development.

Fluoride is important to tooth and bone formation. It makes the teeth harder, and they can resist decay and breakdown. Only two-thirds of the U.S. population receives fluoridated water.

Tips to achieving that goal.

The National Research Council of the National Academy of Sciences recommends one milligram of fluoride for each liter of water consumed.
